ROSS D. SNYDER & ASSOCIATES, INC. PO BOX 164075 AUSTIN, TX 78716-4075			EXAMINER TANG, KENNETH	
			ART UNIT 2195	PAPER NUMBER

DATE MAILED: 06/12/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	09/246,612	MCCORMICK ET AL.	
	<b>Examiner</b>	<b>Art Unit</b>	
	Kenneth Tang	2195	

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 23 March 2006.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-40 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-40 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

### DETAILED ACTION

1. This action is in response to the Amendment filed on 3/23/06. Applicant adds claim 40 and does not make any arguments over the previous office action rejection.
2. Claims 1-40 are presented for examination.

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. **Claims 1-8, 14-18, 22-27, 32-36, and 39-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gehi et al. (hereinafter Gehi) (US 6,134,216) in view of IBM Technical Disclosure (Vol. 34, No. 9, February 1992).**

2. As to claim 1 Gehi discloses a method consisting of the following:
  - receiving plurality of call signaling messages (*call signaling messages, col 2, lines 47-51, "message processor", Fig. 1, item 10*);
  - Comparing queue occupancy level with first threshold (*S(n) compared against threshold X[max,I], col 4, lines 24-49, "overload is measured through the use of a control parameter such as the occupancy of a control processor or the number of entries in a queue of a module of the system", see Abstract*);

- When occupancy level compares unfavorably with threshold, enqueue call signaling messages into processing queue based on type of call signaling messages (*level is changed to be at level (i+1) over the upcoming interval, col 4, lines 24-49*);
- Call processing (*"call processor", Fig 1, 20, and processor, col 8, lines 28-57*);
- Processing module (*modules, processor, col 9, lines 20-30, "network module", Fig. 1, item 30*).

However, Gehi fails to explicitly teach enqueueing the messages based on its type. IBM teaches a message queue communication system having messages enqueued based on their type (*"enqueued message types" and "message of the corresponding type to be enqueued", page 170, paragraph 2*). It would have been obvious to one ordinary skill in the art at the time the invention was made to include the feature of enqueueing call signaling messages based on its type to the existing enqueueing system of Gehi in order to increase selectivity (*select()* and blocking) of the contents in the processing queue (*page 168*).

3. As to claim 2, Gehi in view of IBM fails to explicitly teach using dispensable and indispensable as type of call signaling messages. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include a dispensable type of message to the existing system of Gehi and IBM for the reason of maximizing the communication efficiency by minimizing wasteful communication resources.

4. As to claims 3, Gehi in view of IBM fails to explicitly teach the following:

Art Unit: 2195

- a) when message is dispensable, delete the previous dispensable message;
- b) enqueueing new message when previous one is deleted;
- c) enqueueing message into queue when message is indispensable.

5. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include a) and b) to the existing system of Gehi and IBM for the reason of deleting the old values and adding the new values to the queue for updating/cleanup reasons. In addition it would have been obvious to one of ordinary skill in the art at the time the invention was made to include c) to the existing system of Gehi and IBM for the reason of replacing the dispensable messages with indispensable ones.

6. As to claim 4, Gehi in view of IBM fails to explicitly teach dropping the call signaling message if the previous dispensable one does not exist. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM for the reason of increasing efficiency by removing wasteful resource material.

7. As to claim 5, Gehi in view of IBM discloses a method consisting of the following:

- Comparing queue occupancy level with second threshold (*compared against threshold  $X[\min, I]$ , col 4, lines 24-49*);
- When occupancy level compares unfavorably with threshold, dequeue call signaling messages into processing queue based on type of call signaling messages (*level is changed to be at level (I-1) over the upcoming interval, col 4,*

*lines 24-49, "overload is measured through the use of a control parameter such as the occupancy of a control processor or the number of entries in a queue of a module of the system", see Abstract)).*

8. Gehi in view of IBM fails to explicitly teach the following:
  - a) when message is dispensable, delete the previous dispensable message;
  - b) enqueueing new message when previous one is deleted;
9. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include a) and b) to the existing system of Gehi and IBM for the reason of deleting the old values and adding new values to the queue for updating/cleanup of the queue.
10. As to claim 6, it is rejected for the same reasons as stated in the rejection of claim 4.
11. As to claim 7, it is rejected for the same reasons as stated in the rejection of claim 3.
12. As to claim 8, it is rejected for the same reasons as stated in the rejection of claim 4.
13. As to claim 14, it is rejected for the same reasons as stated in the rejection of claim 1.
14. As to claim 15, it is rejected for the same reasons as stated in the rejection of claim 2.
15. As to claim 16, it is rejected for the same reasons as stated in the rejection of claim 3.

Art Unit: 2195

16. As to claim 17, it is rejected for the same reasons as stated in the rejection of claim 5.

17. As to claim 18, Gehi in view of IBM fails to explicitly teach dropping the call signaling message if the previous dispensable one does not exist. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM for the reason of increasing efficiency by removing wasteful resource material. In addition, Gehi in view of IBM fails to explicitly teach enqueueing the message when the previously indispensable one is deleted. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include the feature of enqueueing the new message for the reason of adding the new values to the queue for updating reasons.

18. As to claim 22, it is rejected for the same reasons as stated in the rejection of claim 1.

19. As to claim 23, it is rejected for the same reasons as stated in the rejection of claim 2.

20. As to claim 24, it is rejected for the same reasons as stated in the rejection of claim 3.

21. As to claim 25, it is rejected for the same reasons as stated in the rejection of claim 1.

22. As to claim 26, it is rejected for the same reasons as stated in the rejection of claim 18.

Art Unit: 2195

23. As to claim 27, it is rejected for the same reasons as stated in the rejection of claim 4.
24. As to claim 32, it is rejected for the same reasons as stated in the rejection of claim 1.
25. As to claim 33, it is rejected for the same reasons as stated in the rejection of claim 2.
26. As to claim 34, it is rejected for the same reasons as stated in the rejection of claim 3.
27. As to claim 35, it is rejected for the same reasons as stated in the rejection of claim 5.
28. As to claim 36, it is rejected for the same reasons as stated in the rejection of claim 3.
29. As to claim 39, Gehi in view of IBM fails to explicitly teach using at least one of FIFO and LIFO. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM because it is well-known that a queue can either operate as FIFO or LIFO.
30. As to claim 40, Gehi in view of IBM fails to explicitly teach using at least one of FIFO and LIFO. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM because it is well-known that a queue can either operate as FIFO or LIFO and it would increase flexibility to operate the queue in either order.

**31. Claims 9-10, 28, and 31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gehi (US 6,134,216) in view of IBM, and in further view of Holmes (US 5,999,969).**

32. As to claims 9, Gehi teaches decreasing the overhead level in a queue when appropriate overload control action of each module is needed (see Abstract) Gehi in view of IBM fails to explicitly teach doing this by dequeuing messages from the call processing queue. Holmes teaches using a message dequeue operation (*col 25, lines 21-25*) with a message queue as a call processing queue (*message queues, col 7, lines 35-37*). However, Holmes fails to explicitly teach doing this in a sustained overloading condition. Moreover, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM for the reason of preventing a burst of overhead data and to stay under the switch's capacity (sustaining overload condition).

33. As to claim 10, Gehi in view of IBM fails to explicitly teach using at least one of FIFO and LIFO. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM because it is well-known that a queue can either operate as FIFO or LIFO and it would increase flexibility to operate the queue in either order.

Art Unit: 2195

34. As to claim 28, Gehi teaches decreasing the overhead level in a queue when appropriate overload control action of each module is needed (see Abstract) Gehi in view of IBM fails to explicitly teach doing this by dequeuing messages from the call processing queue. Holmes teaches using a message dequeue operation (*col 25, lines 21-25*) with a message queue as a call processing queue (*message queues, col 7, lines 35-37*). However, Holmes fails to explicitly teach doing this in a sustained overloading condition. Moreover, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM for the reason of preventing a burst of overhead data and to stay under the switch's capacity (sustaining overload condition).

35. As to claim 31, it is rejected for the same reasons as stated in the rejection of claims 9 and 10.

**36. Claims 11-13, 19-20, 29-30, and 37-38 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gehi in view of IBM in further view of Baldwin (US 6,310,952).**

37. As to claim 11, Gehi and IBM fail to explicitly teach maintaining a plurality of dequeuing lists that track the following:

- locations in the call processing queue;

Baldwin teaches keeping track of that caller's location in a call queue (*col 4, lines 62-67*).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature of tracking the location to the existing system of Gehi and IBM

Art Unit: 2195

for the reasons of having a “pointer” in the queue so comparisons can be made towards the threshold to determine when there is sustained overloading.

38. The system of Gehi, IBM and Baldwin fail to teach tracking the following:

- an ordered list of types of calling signaling messages;
- an ordered list of dispensable messages;
- an ordered list of indispensable messages;

39. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include having types of calling signaling messages to the system of Gehi, IBM, and Baldwin for the reason of increasing selectivity of the contents in the processing queue. Furthermore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include a dispensable type of message to the existing system of Gehi and IBM for the reason of maximizing the communication efficiency by minimizing wasteful communication resources. In addition, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include indispensable messages for the reason of having more message types for selectivity.

40. As to claim 12, Gehi in view of IBM fails to explicitly teach updating the plurality of dequeuing lists when the enqueueing changes occur. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this updating feature to the existing system of Gehi and IBM for the reason of improving accuracy and organization.

Art Unit: 2195

41. As to claim 13, Gehi in view of IBM fails to explicitly teach using at least one of FIFO and LIFO. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM because it is well-known that a queue can either operate as FIFO or LIFO.

42. As to claim 19, it is rejected for the same reasons as stated in the rejection of claim 11.

43. As to claim 20, Gehi in view of IBM fails to explicitly teach updating the plurality of dequeuing lists when the enqueueing changes occur. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this updating feature to the existing system of Gehi and IBM for the reason of improving accuracy and organization.

44. As to claim 29, it is rejected for the same reasons as stated in the rejection of claim 11.

45. As to claim 30, Gehi in view of IBM fails to explicitly teach updating the plurality of dequeuing lists when the enqueueing changes occur. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this updating feature to the existing system of Gehi and IBM for the reason of improving accuracy and organization.

46. As to claim 37, it is rejected for the same reasons as stated in the rejection of claim 11.

Art Unit: 2195

47. As to claim 38, Gehi in view of IBM fails to explicitly teach updating the plurality of dequeuing lists when the enqueueing changes occur. However, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this updating feature to the existing system of Gehi and IBM for the reason of improving accuracy and organization.

48. **Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gehi (US 6,134,216) in view of IBM, in further view of Baldwin (US 6,310,952), and in further view of Holmes (US 5,999,969).**

49. As to claim 21, Gehi teaches decreasing the overhead level in a queue when appropriate overload control action of each module is needed (see Abstract) Gehi in view of IBM fails to explicitly teach doing this by dequeuing messages from the call processing queue. Holmes teaches using a message dequeue operation (*col 25, lines 21-25*) with a message queue as a call processing queue (*message queues, col 7, lines 35-37*). However, Holmes fails to explicitly teach doing this in a sustained overloading condition. Moreover, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include this feature to the existing system of Gehi and IBM for the reason of preventing a burst of overhead data and to stay under the switch's capacity (sustaining overload condition).

### ***Response to Arguments***

50. Applicant does not make any arguments in the Remarks on 3/23/06.

***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kenneth Tang whose telephone number is (571) 272-3772. The examiner can normally be reached on 8:30AM - 6:00PM, Every other Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Meng-Ai An can be reached on (571) 272-3756. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
